Photoshop is a powerful tool, but it can be a dangerous one. Always keep safety in mind when using Photoshop and always use good safety practices when editing your images. This includes making sure to use a strong password for your computer, and that you only access your images through a secure program (not from your home computer). Updating Photoshop Adobe periodically updates its product offerings. This updated version of Photoshop is known as Photoshop CS, denoting that it's the latest version of the program. Photoshop CS6 is the current version, released in 2013. You can update to the newest version of Photoshop on your own, or upgrade your current version if you're already running the newest version. To update, follow the instructions in the Update instructions section later in this chapter. You can read more about Photoshop CS6 online by visiting www.adobe.com/products/photoshop.html. Viewing your image When you first open a Photoshop file, you can view it as a basic image or open it in another program. The default editing program for Photoshop files is Photoshop, but you can also open them in other editors, such as Elements, GIMP, or Paint Shop Pro. The first step is to double-click the Photoshop file you'd like to open. This opens the file in the default Photoshop editing program. When you open an image in Photoshop, you can choose to view it as a thumbnail to preview the image or view it in its full, 12.8-inch version. You can view the image in two different sizes: Full size: The full size for the image is the traditional, newspaper-like print size that most people are familiar with. Preview size: This provides an even closer view of the image, with a slightly larger viewport. It can be resized to any size by dragging the corners of the rectangular selection box on the image. When you open the image in a program other than Photoshop, you usually have to enter the path to the file in the Image Paths dialog box, as shown in Figure 13-1. You can also use the Save As command to save the image in a different file format or to open a previously saved file as a new image. **Figure 13-1:** You can adjust the size of the image. Organizing Your Photos If you need to organize your images so that you have a quick and easy reference, Photoshop includes a very

Q: How to execute a Python script from Bash? Is there a way to execute a Python script from bash? I've looked around and there is nothing that describes how to do this. A: The most common way to execute a Python script from bash is to use the subprocess module (The usage is: `#!/usr/bin/env python import subprocess subprocess.call('script.py')` You will have to replace "script.py" with the name of the script that you would like to execute. Q: Libraries for gRPC on GAE Is there some library that implements gRPC protocol on Google App Engine? I found `grpc-java` and `grpc-web-server`, but they both use OpenSSL (which is not supported on GAE). A: Disclaimer: I am the author of `gRPC-Web-server` and `gRPC-Java` The gRPC Web Server is compatible with GAE by using HTTPS certificates, and as such is not restricted to OpenSSL. The gRPC Java implementation is compatible with GAE in the sense that it uses a very simple core library written in Python that compiles to Java bytecode on GAE. The specific libraries that are used to do the actual RPC requests however are written in Java and most likely would require some changes to the code to work on GAE. If you were to write a different code base on your own, which would allow you to create your own RPC servers, then your dependencies would include supporting libraries that implement the protocol in a language that can be used on GAE. There are certainly libraries that implement a gRPC server in Java. There is no gRPC gateway on GAE at this time. It is discussed here. Q: Importing a named reference section into Simulink Is it possible to import a named reference list into Simulink? I was initially going to create a named reference file like so: But then I discovered that since this is a list, it cannot be imported into Simulink. Is there an equivalent of passing the name of a source (eg text or integer) to the import block? A: If your list are only within Simulink,

Q: Initializing an array of structs I have a structure like this. `struct PageInfo { int iSections; }` I have a function that receives an array of these struct and counts the number of times `iSections` has a specific number. The array is initialized like this. `struct PageInfo* m_pInfoArray = new struct PageInfo[m_nMaxPage]; for(int i=0; i < m_nMaxPage; i++) m_pInfoArray[i].iSections++;` The weird thing is, the function seems to work fine unless `m_pInfoArray[i].iSections` is initialized to 0. When it's initialized to 0, nothing happens. Can someone please point out what I'm doing wrong. Thanks. A: You are creating a local copy of that array. Don't do that. Use the pointer instead: `struct PageInfo * m_pInfoArray = new struct PageInfo[m_nMaxPage]; for(int i=0; i < m_nMaxPage; i++) m_pInfoArray[i].iSections++;`
