1. Field of the Invention This invention relates to ultrasonic imaging, and more particularly, to an ultrasonic imaging system that produces images of the human heart, and optionally, of associated structures of the body of a living patient.
2. Description of the Related Art The human heart is the muscular organ which is responsible for supplying all the blood and oxygen to your entire body. In that respect, the heart represents a kind of life-support system which drives the blood through the vessels of the human body. The heart is a muscular organ which is supported by a skeletal framework (the "skeletal structure") and various membranes (the "pericardium"). The heart has four chambers, and two chambers are associated with each of the four pulmonary veins or "atria" of the heart. Each atrium is the upper chamber of a particular pulmonary vein, and the two atria are connected by a muscular structure called the "atrioventricular septum." The four pulmonary veins empty blood into the right and left ventricles through four pulmonary veins. The left and right ventricles are the muscular chambers which facilitate the flow of blood through the left and right sides of the heart and the blood vessels of the body. The right and left ventricles are separated by the muscular wall called the "interventricular septum." The ventricles contract simultaneously during diastole to pump blood through the aorta and coronary arteries. During systole, the ventricles relax, and the aorta and the coronary arteries are filled with blood. The heart is controlled by intrinsic pacemakers. It also receives extrinsic signals through the influence of the autonomic nervous system. The veins and arteries are supported by collagen fibers and are surrounded by a pericardium which protects the heart and contains the fluid which circulates through the heart and lungs. The pericardium also cushions the heart and serves as a sac for the lungs and the esophagus. The position of the esophagus in relation to the heart is very important, particularly in medical procedures which involve diagnostic imaging. Various internal medical imaging techniques are available for a physician to assess the general condition of the human
