Learn more about the What works really well is the Library module, which makes organizing - and sharing - your files easy. I like having my work consistently organized into bins, and I also like sharing sections within the library. For example, I have one bin for artwork, one for photography, and another one for other coursework, such as my design portfolio. I can easily move the photograph and the art files to a different folder or share a specific filenames with a colleague, colleague, or a client via Dropbox. Once an item is shared, it appears in another folder, just like it would on a hard drive. You can easily forget that you had staged the image. Or, you can send the item to a client with the push of one button. On the other hand, I prefer to have them "live" inside the Library, since that way they stay in sync with external files without having to duplicate them. This is especially useful when it comes to clients, since you don't need to lose a file when they ask you to edit it, you just move the item to another folder or subfolder, and then you can change the version you track inside the browser.

In addition, the new GPU architecture allows Photoshop to run faster and be more power efficient. NVIDIA has already demonstrated its own image quality improvements with the latest release of its

GeForce RTX GPUs. As NVIDIA has the advantage of having much better hardware for image processing, these gains should be higher for Photoshop on its own CUDA-based platform. The other main reason for making the switch to the new GPU architecture is that the new APIs are more stable for GPU developers. This will allow Photoshop to use CUDA-based APIs across multiple platforms. The latest version of Photoshop is now available for the Mac. Designed to work seamlessly with its Creative Cloud counterparts, the new update allows you to edit, organize, and work on multiple versions of an image or photo simultaneously.
